

DAY:- 15

1 . What is Netlify?

Netlify is a cloud-based platform that makes it easy to **host and deploy static websites and front-end applications**. It automates the process of building, deploying, and serving websites directly from your GitHub, GitLab, or local files. Netlify provides features like **free hosting, custom domain support, HTTPS, form handling, and continuous deployment** from source control.

How it works:

- You push your project to GitHub or drag and drop the folder manually.
- Netlify builds the project and hosts it automatically.
- Any changes pushed to your repo will instantly update the live site if auto-deploy is enabled.

2. How to Deploy a Project on Netlify?

◆ Step 1: Prepare Your Project

- Make sure your project folder contains:
 - index.html (main page)
 - css/, js/, and images/ folders
- Your homepage must be index.html and placed in the **root directory**.

◆ Step 2: Open Netlify

- Go to: <https://www.netlify.com>
- Click on "Sign up" or "Log in" with your GitHub, email, or Google account.

◆ Step 3: Start a New Site

- After logging in, click "Add new site".
- Choose "Deploy manually".

◆ Step 4: Upload Your Project

- Drag and drop your **entire project folder** (with HTML, CSS, JS, and image files) into the upload area.

- Netlify will automatically process your files.

◆ **Step 5: Get Your Live Link**

- Within a few seconds, Netlify will give you a **live site URL** like:

<https://poetic-cucurucho-7fa76b.netlify.app/>
